

Pea Seed Harvesting

Growing and Harvesting Peas

NDSU Extension – Cavalier County

Tips and Tricks

Cross-pollinating, although not often, can occur between peas so be sure to isolate different pea varieties when growing for seed (at least 20 feet).

Allow at least 1 pea plant in the garden, with at least 10 pods, to continue to dry for seed production.

Seed pods will not split when drying in the garden.

Planting Peas

Be sure to follow the planting instructions on either the original seed packets or the seed envelopes checked out from the Cavalier County library.

In-Season Considerations

When seedlings are 1-2 inches tall, thin to stand about 4-6 inches apart to reduce overcrowding and encourage healthier peas. Thinned out plants can be eaten as microgreens which can be eaten alone or used as a topper on salads, sandwiches, etc.

Harvesting Peas

- Leave plants to flower.
- Seed pods will form from the flowers.
- Leave standing in the garden until dry.
- Carefully pull seed pods from plant, remove seeds from pods, and place only the seeds into the envelope.
- A suggested minimum return amount is 1 and ½ teaspoon.
