In a nation of poverty and luxury finding a place where both lifestyles can interact and co-exist naturally can be a challenge. The Container Village Community is a small cluster of growing life. The units are designed to be affordable, sustainable and innovative, keeping the integrity of the containers with the constraints on size and volume in mind. Striving to be as close to “net zero” as possible, this multi-unit, multi-generational housing project will be constructed using green colored shipping containers arranged to form the specific needs of the people living in them.
The Container Village project shows how the shipping containers can be studio spaces, 1 bedroom, 2 bedroom and 3 bedroom living units. The containers on the garden level are intended to host commercial/retail space along with areas for gathering in the outdoor plazas.

The stackable nature of these boxes allows them to be added and subtracted to meet the occupants desired needs. The site itself has the design potential to hold upwards of 250 containers for various uses. Our design allows for sustainable techniques and innovative technologies to be implemented at any point in time. These concept floor plans simply show what could be possible for the units and some ideas for placement.
