

Google Hacking

19 September 2013

Updated August 2015

#s

Google's cache is over 95 Petabytes

Google crawls **300** cached entries per host by default

(If the site's SEO ranking is higher, then Google crawls deeper)

Getting Google To Scan For You

If a site isn't being crawled for some reason, (like it doesn't have a DNS entry) you can solve this problem by:

- a) Adding a **DNS entry** for the site publicly
- b) Creating a **Custom Search** under a Google user account

If you create a custom search and add the IP, the site will be indexed within 7 days

#s

Numbers From Sept 2013

.com sites: 25,270,000,000

.org sites: 2,510,000,000

.jp sites: 15,550,000,000

A Word of Caution

Hackers love pulling practical jokes on each other. What constitutes a practical joke is a personal decision that can range from a funny message, a 'like a sir' image, or deleting your computer.

You should always hack on a machine that's useless and and on a separate network than

Machines containing sensitive
Data.

This is Google's cache of http://www.ssina.com/download_a_file/entries.log. It is a snapshot of the page as it appeared on Aug 28, 2013 15:55:27 GMT. The page could have changed in the meantime. [Learn more](#)
Tip: To quickly find your search term on this page, press **Ctrl+F** or **⌘-F** (Mac) and use the find bar.

These search terms are highlighted: **juniper**

Rigging a Sweepstakes

So those numbers count up with each entry, eh? I wonder what happens when they hit “41/41” ...

A screenshot of a web browser window. The address bar shows the URL 'www.discoverokoboji.com/sweepstakes/app/log/winner-2010-06-01.txt'. The main content area displays a log entry: '2010-06-01T07:40:33-05:00 ALERT (1): user_id:32 entrynum:41 email:sjb2001@gmail.com name:Scott Burbank ip:74.33.133.59 hostname:74-33-133-59.dr01.ftdd.ia.frontiernet.net browser:Mozilla/4.0 (compatible; MSIE 7.0; Windows NT 5.1; .NET CLR 1.1.4322; .NET CLR 2.0.50727; .NET CLR 3.0.4506.2152; .NET CLR 3.5.30729; OfficeLiveConnector.1.4; OfficeLivePatch.1.3)'.

```
2010-06-01T07:40:33-05:00 ALERT (1): user_id:32 entrynum:41 email:sjb2001@gmail.com name:Scott Burbank ip:74.33.133.59 hostname:74-33-133-59.dr01.ftdd.ia.frontiernet.net browser:Mozilla/4.0 (compatible; MSIE 7.0; Windows NT 5.1; .NET CLR 1.1.4322; .NET CLR 2.0.50727; .NET CLR 3.0.4506.2152; .NET CLR 3.5.30729; OfficeLiveConnector.1.4; OfficeLivePatch.1.3)
```

Winner!!!

Now tomorrow, we can just watch the entries txt file, wait until it gets close, and enter when we know we'll win!

[Add New Record](#)

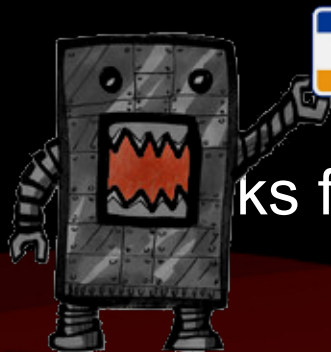

There are 2 ways to use the counters:

- 1) Use the Link-to URL as a destination link, and every click on that link will count and then redirect to the Destination URL (eg to count click-throughs to a reservations engine)
- 2) Use the Image URL as an image source in an HTML page, and every view to that page will count (no Destination redirect - eg to count form submissions if used on response page, or total visits if used on homepage)

Something Sinister

That is an admin for a link manager. They have links across their site that point to the ID numbers. This software tracks the clicks, then forwards the client on to the destination.

So if we edit the destinations to our phishing sites, visitors would book a hotel through our phony site!

ks for the **CC#s!**

Amazon Wispernet
Kindles, Cloud Storage, etc

Kindle

Steps to add file to Kindle:

1. Email file to kindleid@free.kindle.com
2. Wait for file to show up on your Kindle
3. File is automatically stored on Amazon S3

Voicemail

VOICEMAIL SETUP

The initial mailbox setup process is as follows:

From your office telephone, dial the Voice Mail number (see below). When prompted enter your temporary password 200845#.

You know what'd be convenient? A list of recent recruits who maybe haven't set up their voicemail yet...

Access to Source Code allows attackers to create exploits much faster. Subversion (SVN) repositories may also leak passwords and other sensitive information by mistake.

The image shows a search engine results page for the query "site:.mil inurl:adh.usace.army.mil/svn". The search results are displayed on page 2 of approximately 63,900 results, with a search time of 0.24 seconds. The results list several documents from the ADCIRC and HDF5 source code repositories, including installation instructions, a developers guide, and source code files for HDF5 and HDF5D.

This data is on a Military University website. The log is showing not only internal directory information, but that data is being linked externally. The medpix.50megs.com site no longer exists. I can register it myself and replace these images with ones containing exploit code. When the images are pulled up by users they may get infected.

The screenshot shows a web browser window with the address bar containing `rad.usuhs.mil/rad/location/gross/WS_FTP.LOG`. The page content is a log file with the following entries:

Htaccess files are used in Linux and Unix systems to control directory permissions on web servers. These can contain passwords, usernames, or as seen below, internal IP addresses allowed to access the folder. If we know what this scientist is working on, we now know which internal machine is his and the IP's of co-workers working on the same project. Excellent targeting information to gather before breaking into the network. Its good that he has this set, because his entire profile and saved documents is publically available on the internet....

The previous slide showed an example of Directory Traversal. This is when a directory on a webserver is not locked down, and an unauthorized user can browse files. Desired behavior would be to show a “you are not authorized” error message. Being able to traverse directories allows us to find files we really shouldn’t have access to. To reliably locate directory traversal attack points, use the following search.

This is the log file found in the previous slide. Note that the username, failed password, and IP address is logged. The IP shows that this system is accessible over the internet. Users often fat-finger passwords, and as such if I download this file and pull all passwords for the user, I will likely see the common misspells and be able to guess the real password reliably before the account is locked out.

If the user logs in from home I can also target his home network, which will have significantly less security than the military networks. I hope.

```

To break into a system we often need a username and a password. Usernames are sometimes more difficult to locate than passwords, since we have password lists that can guess. Its useless and time consuming to guess usernames as well as passwords. So if we can find a list of known users of a system, then half of the authentication challenge has been solved.

The following is an interesting security vulnerability in Microsoft Sharepoint which has never officially been disclosed. This would be considered a feature except that it can have devastating effect. Sharepoint has users, and is often tied to Microsoft Active Directory. To setup users in Sharepoint, an admin goes to a page called `acinv.aspx`. Unfortunately any authenticated user can view this page, they just can't setup users. This can disclose a lot of internal user information such as name, email, phone number, title, internal usrid, etc. For the entire organization. The big problem is that many organizations allow external visitors to create an account to login and make them have "guest" or low-level access. Sharepoint doesn't recognize the custom permissions, which allows someone from the internet to login and interrogate your Active Directory. This is a good example of using `inurl` to locate known vulnerable websites.

Below you will find a list of few Fortune 500 companies using SharePoint technology for their public-facing websites. This review is trying to highlight the adoption of SharePoint in the corporate world as well as the customization level these companies accomplished.

Finding corporate websites with interesting designs in Fortune 500 and on SharePoint platform proved to be a challenge. If I missed any company that meets the above criteria feel free to add it in the comment area.

Below is a German site which allows user creation and then guest access

A, B. 1, SETTINGS E-JEWELS. 2. 3, Server. 4, Username, administrator. 5, pass, 123qwe!! 6. 7, IIES SERVER, Http:// 79.129.1.84/inovera. 8. 9, Router ...

The image shows a screenshot of an Excel spreadsheet titled "Pass E-jewels.xlsx". The spreadsheet is in "PROTECTED VIEW" mode, with a warning message: "Be careful—files from the Internet can contain viruses. Unless you need to". The spreadsheet has columns A, B, and C, and rows 1 through 19. The title "SETTINGS E-JEWELS" is centered in row 1. The data is organized into sections for different routers, each with a "Server" label and associated "Username" and "pass" values.
