

**MATH 724
SUMMER 2009
HOMEWORK 2**

Some other (not necessarily distinct) time.

1. (5 pt) Consider the diagram

$$\begin{array}{ccccccc}
 & & \downarrow & & \downarrow & & \\
 & & P'_1 & & P''_1 & & \\
 & & \downarrow & & \downarrow & & \\
 & & P'_0 & & P''_0 & & \\
 & & \downarrow & & \downarrow & & \\
 0 & \longrightarrow & A' & \longrightarrow & A & \longrightarrow & A'' \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \\
 & & 0 & & 0 & &
 \end{array}$$

where the columns are projective resolutions and the bottom row is exact. Show that there is a projective resolution of A and chain maps such that the columns form an exact sequence of complexes.

2. (5 pt) Let $0 \longrightarrow A \longrightarrow B \longrightarrow C \longrightarrow 0$ be a short exact sequence of R -modules. If T is a covariant (additive) functor then show that there is a long exact sequence

$$\cdots \longrightarrow L_n TA \longrightarrow L_n TB \longrightarrow L_n TC \longrightarrow L_{n-1} TA \longrightarrow \cdots$$

$$\cdots \longrightarrow L_0 TA \longrightarrow L_0 TB \longrightarrow L_0 TC \longrightarrow 0.$$
