

Physics 171 - INTRODUCTORY PROJECTS IN PHYSICS (1 credit) – Fall 26

Specific Course Information:

Instructor: Alan Denton, South Engineering 214B

email: Alan.Denton@ndsu.edu, web: <https://www.ndsu.edu/people/alan-denton>

Faculty Mentors: Sylvio May, Alexander Wagner, Andrei Kryjevski

emails: Sylvio.May@ndsu.edu, Alexander.Wagner@ndsu.edu, Andrei.Kryjevski@ndsu.edu

The instructor also serves as a Faculty Mentor.

Bulletin Description: This course is designed for first-year students who plan (or consider) pursuing a degree in physics. With their peers, students work in small groups to complete multiple introductory physics projects, which are typically open-ended problems that may or may not have a hands-on (laboratory) component. Student groups are supported by faculty mentors and share ideas and approaches with their peers.

Objectives: This course engages students in investigating physics projects, open-ended problems that may not have a straightforward solution. The goal of the course is to inspire students to (1) be creative, explorative, confident, and persistent in addressing a complex physics question, (2) extract information, identify approaches, and seek help when needed, (3) make approximations and perform measurements if needed, (4) communicate with peers and present progress and results. The overall objective is to expose students early to the explorative and collaborative mindset that is one component of a successful physicist career. The course also facilitates cohort formation of students who share an interest in physics.

Prerequisites: none

Meetings: Wednesdays 2-2:50pm in South Engineering rooms 221 and 314. According to NDSU Policy 333, attendance of this in-person course is expected.

Office hours: Wed 11am-12pm in South Engineering room 214B.

Textbook and other resources: This course does not have a textbook. Depending on the project, and following guidance from your faculty mentors, it may be beneficial to consult physics books from the NDSU Library. The responsible use of online resources is also encouraged.

Topic Outline and Timing:

The course consists of two projects for each student, with a final report and presentation at the end of each:

Week 1	Introduction, formation of groups, selection of Project 1
Week 2-5	faculty presentations, progress reports, group work on Project 1
Week 6	Preparation of presentation and of final report for Project 1
Week 7	Presentations and submission of final report for Project 1

Week 8	Introduction, formation of new groups, selection of Project 2
Week 9-12	faculty presentations, progress reports, group work on Project 2
Week 13	Preparation of presentation and of final report for Project 2
Week 14	Thanksgiving Break
Week 15	Presentations and submission of final report for Project 2

Week 16	Recapitulation and summary of what we accomplished. Collection of ideas for new projects.
---------	---

Format: Class meetings start with short faculty presentations and progress reports from student groups. The bulk of the course is collaborative work of the students in a group. Each group has a faculty mentor who provides support and guidance if needed.

How to succeed: This course is explorative. Creativity and collaboration are key to success. Pursuing a reasonable idea is valuable even if it turns out unsuccessful. You will have to decide what approximations to make and resources to use. You need to be able to explain what you do and why. AI agents such as ChatGPT can be helpful, but be very careful with its unreflected use. Faculty mentors are there to help and provide some guidance, but the key is your communication with your peers.

Course Management System: Blackboard Ultra

Final Report and Presentations: Each project is concluded by a written final report and a 15-minute-long presentation. All students in a group participate in preparing the report and in the presentation. The report is typically a few pages long and must be submitted before the presentation. Each class meeting in weeks 2-6 and weeks 9-13 starts with a ~5-minute-long progress report from each group. Faculty mentors may add short presentations to explain underlying physics that is of general interest.

Grading: The maximum score is 100 points. Beyond that, extra credit may be awarded if appropriate.

Project 1: progress reports 20 points, final report 10 points, final presentation 20 points

Project 2: progress reports 20 points, final report 10 points, final presentation 20 points

Grading scale 0-54 points F, 55-65 points D, 66-76 points C, 77-87 points B, 88-100 points A

Grading of the final reports and presentations assesses the ability (1) to make a compelling case toward investigating a complex physics problem and (2) to convincingly communicate your findings to peers and to faculty mentors.

General Course Information:

- Any students with disabilities who need accommodations in this course are invited to share these concerns or requests with the instructor and contact the Center for Accessibility and Disability Resources as soon as possible.
- The academic community is operated on the basis of honesty, integrity, and fair play. NDSU Policy 335: [Code of Academic Responsibility and Conduct](#) applies to cases in which cheating, plagiarism, or other academic misconduct have occurred in an instructional context. Students found guilty of academic misconduct are subject to penalties, up to and possibly including suspension and/or expulsion. Student academic misconduct records are maintained by the Office of the Provost. Informational resources about academic honesty for students and instructional staff members can be found at <https://catalog.ndsu.edu/academic-policies/academic-honesty-integrity>.
- All access to NDSU computers must respect NDSU Policy 158: [Acceptable use of Electronic Communication Devices](#).
- Your personally identifiable information and educational records as they relate to this course are subject to FERPA.
- Veterans and student service members with special circumstances or who are activated are encouraged to notify the instructor as soon as possible and are encouraged to provide Activation Orders.

Academic Integrity and Generative Artificial Intelligence Policy:

Students are allowed and encouraged to use advanced AI tools, such as ChatGPT, throughout this course in a way that supports understanding of the course material and prepares for the in-class presentations (during which the use of any AI software is not permitted).

All writing submitted, however, must be produced by the student. When appropriate, ideas, phrases, and words from other sources can be integrated into student work with proper attribution. In all writing, ideas and words adopted from any source must be attributed (referenced) to the original source.

Part of our course will focus on helping understand how and when to give credit to other sources or authors, and why it is a standard academic convention to do so. We will also discuss the role of AI in problem solving, research, and scientific writing processes. Ultimately, each of us must be responsible and accountable for work we produce. Remember: “With great power comes great responsibility.” [1]

Any work that is not produced by a student in this course without attribution, whether written by a human or AI, is a violation of the University’s academic regulations and will be subject to disciplinary action. Any composition generated by ChatGPT or other AI composition software that is submitted as the student’s own writing without acknowledging the role that AI played in its production violates academic integrity policy.
